

PRELIMINARY REPORT

Census on Computer Literacy of Academic Staff of Government Schools, Approved Private Schools and Pirivenas - 2006

**Department of Census and Statistics and
Ministry of Education**

Preliminary Report

Census on Computer Literacy of Academic Staff of Government Schools, Approved Private Schools and Pirivenas - 2006

**Department of Census and Statistics and
Ministry of Education**

PREFACE

Use of technology in education can lead to a range of beneficial education outcomes. In getting students ready for the 21st century, technology has the potential to enhance the achievement of students, increase families' involvement in their children's schooling, improve teachers' skills and knowledge and improve school administration and management.

Computer-assisted learning has been shown to have a strong positive effect on educational outcomes. Computer skills are some of the most important technical skills that a student can possess in the new economy. The Internet is a major research tool for students. Teacher attitudes towards computer technology may be a significant factor in the implementation of use of computers in education. Computer literate persons will utilize available resources and seize opportunities than their counterparts who lack that knowledge. The government is investing in an extensive way to improve the computer literacy of students and teachers. To evaluate the impact of these investments, ICT literacy of students and teachers should be measured from time to time in a regular manner.

This is the first study conducted in Sri Lanka, on the competencies of teachers in ICT. The idea of conducting this census was well accepted by the Ministry of Education who extended their fullest cooperation to conduct this study successfully. I am thankful to the Hon. Minister of Education, Mr. Susil Premajayantha; the Secretary to the Ministry of Education, Mr. Ariyaratna Hewage and the Additional Secretary - Planning and Progress Review Division, Mr. S. U. Wijeratne for their invaluable contributions. I am thankful to Dr. Amara Satharasinghe, a Deputy Director of this Department for designing the census, managing its implementation, data analysis and preparation of this report.

Several strategies were adopted to ensure the successful completion of the census. Training all staff systematically within a short period, closing schools on the census day at 1100h leaving academic staff to have sufficient time for completion of census schedules and bringing the completed census schedules within a record low time period of 4 days to Colombo are some of them. The role-played by Mr. P. N. Illapperuma, Director of Education, Data Management and Research Branch and his team is highly commended. His team was responsible for printing and distribution of questionnaires, organization of training and bringing the completed census schedules back to Colombo. I place on record my appreciation to the team comprising of Ms. K. M. D. Rashika, Mr. T. K. C. A. Katulanda, Ms. N. H. Thushanthi – Data Entry Operators, Ms. S. N. Udara – Management Assistant, Mr. H. M. A. W. Herath – Senior Statistician, Mr. Dilan Priyantha – System Analyst of the Department of Census and Statistics for their untiring contributions including data verifications. Contribution of the Data Processing Division of the Department under the supervision of Ms. S. V. Nanayakkara, Director and Mr. W. H. P. W. Weerasiri, System Analyst is well acknowledged.

This report presents the preliminary findings. The final report will be released later. I hope the findings will be helpful for the educators to find support, inspiration, and innovative ideas which they can put to work in schools. If the information that is uncovered will prompt decisive action to empower teachers to take advantage of ICT as a tool to improve child friendly teaching and enhance student performance, then the efforts invested in this joint initiative by the Ministry of Education and this Department would have served its purpose.

D. B. P. S. Vidyaratne
Director General
Department of Census and Statistics

10 December 2006

ACKNOWLEDGEMENT

Many individuals and organizations contributed in various ways to conduct this census successfully. Although it is not possible to acknowledge all the contributions, some major ones are listed below. All contributions are deeply appreciated.

Contribution	Contributors
1. Operational team of the Department of Census and Statistics	<i>Dr. Amara Satharasinghe - Deputy Director, Mr. H. W. Herath - Senior Statistician, Mr. Dilan Priyantha - System Analyst, Ms. K. M. D. Rasika and Mr. T. C. K. Katulanda - Data Entry Operators, Ms S. N. Udara - Management Assistant</i>
2. Operational team of the Ministry of Education	<i>Mr. S. U. Wijeratne - Additional Secretary - Planning and Progress Review Division, Mr. P. N. Ilapperuma - Director of Education - Data Management and Research Branch, Mr. G. M. N. Gunadasa - Director of Education - ICT Education Branch, Ms. M. I. Peiris- Deputy Director of Education - Foreign Agencies Branch</i>
3. Preparation of census schedules	<i>Mr. Dilan Priyantha - System Analyst, Mr. H. W. Herath - Senior Statistician, Ms. K. M. D. Rasika and Ms. J. M Uthpala Jayasekara, Data Entry Operators, Ms. Hemanti Peris - Management assistant of Department of Census and Statistics, Mr. P. N. Ilapperuma - Director of Education - Data Management and Research Branch, Mr. S. Puwaneswaran - Deputy Director of Education - Ministry of Education</i>
4. Translation of Questionnaires	<i>Mr. W. J. Nigamuni - Deputy Director, Mr. M. H. M. Ifaham - Management Assistant - Department of Census and Statistics</i>
5. Training of Zonal and Divisional Officers of the Ministry of Education	<i>Dr. Amara Satharasinghe - Deputy Director - Department of Census and Statistics, Mr. P. N. Ilapperuma - Director of Education, Mr. S. Puwaneswaran - Deputy Director of Education, Mr. L. D. Upali - Systems Analyst - Ministry of Education</i>
6. Supervision of Printing and Distribution of schedules	<i>Mr. H.W. K. Amarasinghe - Systems Analyst - Data Management and Research Branch - Ministry of Education</i>
7. Provincial Coordination	<i>Western - Mr. Y.A.N.D. Yapa - Director of Education - National Colleges of Education Branch Central - Ms. Priyatha Nanayakkara - Deputy Director of Education - English and Foreign Languages Branch Southern - Mr. Wijedasa Hewawitharana - Deputy Director of Education - Science and Mathematics Branch Northern and Eastern - Mr. S. Puwaneswaran - Deputy Director of Education - Data Management and Research Branch North Western - Mr. K. G. Pushpakumara - Deputy Director of Education - Languages and Humanities Branch North Central - Mr. I. M .K. B. Ilangasinghe - Director of Education - School Supplies Branch</i>

Contribution	Contributors
	<i>Uva – Mr. Douglas Ranasinghe - Director of Education - Science and Mathematics Branch</i> <i>Sabaragamuwa - Mr. Sepala Kuruppu Arachchi - Director of Education - School Library Development Project of the Ministry of Education</i>
8. Field coordination	<i>All Provincial, Divisional and Zonal Directors of Education and Deputy Directors of Planning, of Ministry of Education and Principals/Heads of participated schools</i>
9. Participation in the census	<i>All academic staff of the government schools, approved private schools and pirivenas</i>
10. Data coding	<i>Mr. W. T. D. P. D. Subaweer - Statistical Officer, Ms. R. T. Samanthika - Statistical Assistant, Ms. Amila Senevirathna, Mr. D. M. P. Jayalath, Ms. M. D. G. S. A. Karunaratna, Ms. S. M. Liyanage, Ms T. Gunawardana Data Entry Operator/Coding Clerks, Mr. Chinthaka Alahakoon, Mr. K. J. Chandana, Ms. Y. K. Ranaweera, Ms. W. G. T. Weerasinghe, Ms. A. D. Ranasinghe - Data Entry Operators, Ms. M. A. R. Wijesinghe – Cartographer of the Department of Census and Statistics</i>
11. Publicity	<i>Media Institutions participated in press briefings and telecast/broadcast /published news items/programmes on this activity. Media Unit of the Ministry of Education, Mr. M. G. Perera, Statistical Officer – Department of Census and Statistics</i>
12. Secretarial assistance	<i>Ms. A. M. D. C. Amarasooriya, Mr. S. A. Pradeep Samantha, Mr. H. B. G. Nilupa, Ms. Renuka Jayaseeli of Department of Census and Statistics</i>
13. Data Verification	<i>Mr. Karunadasa Liyanage – Deputy Director – Ministry of Education and Ms. Wasana Jayakody – Senior Statistician and her Staff of Statistics Unit – Ministry of Education</i>
14. Data analysis and preparation of the report	<i>Dr. Amara Satharasinghe, Deputy Director, Department of Census and Statistics</i>

Executive Summary

The Census on Computer Literacy of Academic Staff of Government Schools, Approved Private Schools and Pirivenas was conducted to find out the computer literacy levels of teachers and ICT related facilities and hardware available in schools. This census was conducted on 2nd November 2006. Two census schedules were used to collect data. One schedule was used to collect data from each and every member of the academic staff. The second schedule was used to collect data on ICT related facilities and hardware available in schools and a summary of the first schedule. The preliminary findings are presented here disaggregated by district, category of school and school size category.

To use the ICT in teaching and learning process there are some basic ICT related facilities need to be available in schools. Electricity is one such facility. The level of availability of electricity is very impressive. About three fourth of schools/pirivenas have this facility. The linkage of telecommunication and computers is behind the rapid developments in the field of ICT. To obtain information using Internet, schools should have a telephone connection. Availability of a land phone is at low level and only 26 percent of schools/pirivenas have land phones. Internet facility and e-mail facility are available in very small proportions of 6.4 and 4.1 percent of schools respectively. Having a computer laboratory, a library and books/magazines on ICT is useful to encourage students and teachers to use ICT in teaching and learning processes. Although 72 percent of schools/pirivenas have a library, only 17 percent of schools have a computer laboratory. Books/magazines on ICT are available only in 27 percent of the schools.

Availability of hardware in schools/pirivenas was also assessed in this census. Computer is a key factor in using ICT in schools. Nearly 30 percent school/pirivenas have computers and about 26 percent of schools have computer printers in working conditions.

A widely used indicator on the infusion of computers to education system is students-computer ratio. That is the number of students per computer. This ratio for schools/pirivenas now stands at 137. Teacher-computer ratio is 7. Development of technological knowledge of teachers is very important in using ICT for making revolutions in the learning and teaching process in classrooms. Students-computer literate teacher ratio is 56 and this is three times higher than the normal students-teacher ratio 18.

Scanners and multimedia projectors are very useful but expensive hardware in using ICT for education to all students in schools across the country. For example teaching about pests in biology for GCE (A/L) students can be done in two ways. One way is to use a textbook where pictures of pests in black and white are given with several paragraphs written describing them. Here there is a risk of different students understanding these features differently. The other method is to find colour pictures/video clips of pests from a book or by searching in the Internet and displaying it on a large screen using a multimedia projector. If this method or similar alternative method was used, the knowledge can be imparted more effectively. This method requires that schools have scanners and multimedia projectors. Percentages

of school with scanners and multimedia projectors are 5.8 and 2.3 percent respectively. Only 0.5 percent of schools have laptop computers.

Most of the facilities and hardware are more available in national and Navodya schools and to a similar extent in private school. Other government schools, which are also, the small student size schools are the least well equipped with ICT facilities and hardware.

Three self-reported indicators on teachers' language and computer literacy were assessed. Those were computer awareness, computer literacy and English language literacy. Nearly 60 of the teachers of schools/pirivenas have the computer awareness, which was defined as knowing about at least one use of computers. This ratio for male teachers and female teachers are 63 and 58 percent respectively. Self-reported computer literacy of teachers, which was defined as the ability to use a computer and do some work on their own, of school/pirivenas is 32 percent: male teachers 39 percent and female teachers 30 percent. This means on an average two third of the teachers of schools/pirivenas cannot do even a simple task using a computer on their own.

Percentage of teachers in schools/pirivenas who reported that they could read and understand documents written in English language is 54 percent: male teachers 56 percent, female teachers 53 percent. A statistical test carried out on relationship between English language literacy, computer awareness and computer literacy shows that there is no significant relationship between English language literacy and computer awareness, but there is a significant positive relationship between computer literacy and English language literacy. Also as expected there is a strong relationship between computer awareness and computer literacy. Another statistical test carried out at district level revealed that there is no statistically significant relationship between computer literacy of teachers and availability of computers in schools. This is a cause for concern. Having computers in schools alone do not improve the computer literacy of teachers. Traditional teaching using blackboards and textbooks perhaps is the dominant mode of teaching still and teachers have little or no time to use whatever available ICT facilities to enhance their own skills or to teach. This points to the need for policies and action to promote the use of ICT facilities by teachers.

It is a worldwide-accepted fact that use of ICT in education can bring about positive changes to the society, which requires infrastructure facilities such as electricity, telephone, educational software, Internet facilities and hardware such as computers, scanners, and multimedia projectors. The levels of educational indicators such as enrollment rate, gender parity in education, primary education completion rate etc is very impressive. But issues, such as poverty, unemployment etc are still persistent. This emphasizes the need to improve quality of education and providing equal education for all students across the country. ICT is influential in providing equal education for all students. Even though all schools do not have required facilities innovative thinkings can bring solutions until the necessary facilities can be provided. For example, without expecting teachers of rural schools to develop educational materials, standard materials can be prepared with very user-friendly multimedia tools and copies burnt into compact disks can be distributed to all relevant schools. This will promote providing equal education for all students. Covering these aspects, there is a need to prepare a ICT policy for the Education system of the country to obtain the maximum benefits of the rapid developments in ICT for teaching and learning process in the class rooms.

1. Introduction

About four million children are studying in 9,727 government schools in Sri Lanka according to the 2005 School Census conducted by the Statistics Unit of the Ministry of Education. These children are taught by about 187,300 teachers of whom 28 percent are university graduates. These students, as their counterparts in developed and indeed in many developing countries, need to benefit from Information and Communication Technology (ICT) which is now being regarded as a new literacy, as important for their future as reading and writing have been previously.

The recognition of the importance of equipping students for the twenty-first century society with both the confidence and the ability to use new technologies effectively and creatively in every aspect of their lives, should take place alongside a growing acceptance that the same tools offer the potential to revolutionize teaching and learning. For example, teaching students how to research a topic on the Internet can give them an important skill, which they need again in the future in both their professional and personal lives. At the same time, teachers using the internet effectively in a lesson can more effectively motivate students, build teacher-student interaction, enhance classroom dynamics and so on, compared with traditional methods.

Computers offer exciting approaches to teaching that were not even dreamed of twenty years ago, but the extent to which the educational potential of computer technology will be realized remains to be seen. Use of computers can revolutionize teaching and learning, and could bring advances that would improve education dramatically. Ordinary students would make massive gains, and bright students could meet greater challenges. Wherever illiteracy is a problem, it would be eliminated, and handicapped students would have vast new vistas opened to them.

Ability for intelligent and efficient use of computers and software to accomplish practical tasks is generally defined as computer literacy. ICT has become embedded into all aspects of all fields and education is no exception. Computer literacy of teachers is of vital importance. Teachers should be able to use computers and teaching software and materials. This, in turn, will motivate students and thus improve the traditional teacher-to-student learning.

Teacher attitudes toward computer technology may be a significant factor in the use of computers in education. Computer literate individuals will reap greater benefits than their counterparts who lack that knowledge. To promote computer literacy of both teachers and students, the government is investing considerably. To evaluate the impact of these investments, and thereby help ensure that the intended results are achieved, ICT literacy of students and teachers should be measured periodically.

For this purpose, the Department of Census and Statistics and the Ministry of Education conducted a census on computer literacy of teachers titled "Census on Computer Literacy of Academic Staff of the Government Schools, Approved Private Schools and Pirivenas – 2006". All academic staff of the government schools, approved private schools and pirivenas was enumerated.

This census was conducted under the Census Ordinance of the Department of Census and Statistics. Under this ordinance, respondents are required to provide accurate information requested by the Department. Department is bound not to divulge any information at individual level. Only statistics at aggregate levels will be published. Therefore, teachers were requested to report their perceptions of their competencies and teachers were assured that information provided by them would not be divulged with identification information of individuals.

The findings of the census will be helpful in many ways. Studies have shown that there is a positive correlation between student performance and teacher professional development. Educators could find support, inspiration, and ideas they can put to work in schools. It is expected to prompt decisive action to empower teachers to take advantage of ICT as a tool to improve teaching learning process and student performance. In Sri Lanka, there have been no studies conducted in this area before. As such this census will be used as a baseline and by repeating this census at regular appropriate intervals impact of interventions in improving the ICT literacy of teachers can be monitored.

The findings on the computer awareness, computer literacy and language literacy presented in this report are based on the summaries provided by the coordinators appointed at school level for conducting the census. They tallied the number of male and female teachers separately who said 'yes' for the three questions on the computer awareness, computer literacy and English language literacy in the schedules completed by the teachers and reported in the Summary Form. Data provided by teachers themselves are being computerized and findings will be published in the final report.

This report presents the preliminary findings of the census. There are nine sections in this report. An introduction is given in the Section 1. The process of data collection is briefly described in the Section 2. Data from a few districts are yet to be received. Coverage of the census is discussed in Section 3. Section 4 and Section 5 are on the availability of ICT related facilities and hardware respectively, in schools. Presented in Sections 6, 7, 8 and 9 are patterns in teachers' self reported computer awareness, literacy, students-computer literate teacher ratio and teachers' self reported English language literacy respectively.

2. Process of data collection

The data collection process utilized the administrative structure of the Ministry of Education. For administrative purposes, of the Education System, Sri Lanka is subdivided into 93 Zones and 323 Divisions. Each Zonal Office and Divisional Office is headed by a Zonal Director and Divisional Director respectively. Approximately 230,000 teachers are employed in Government Schools, Approved Private Schools and Pirivenas.

The Department of Census and Statistics and the Ministry of Education trained three officers from each Education Division, namely Divisional Director, Planning Officer and a teacher familiar with the ICT, on completing the schedules. These officers trained a teacher from each school of the division and they were appointed as school coordinators.

The census was conducted on 2nd November 2006. To make sure teachers complete the census schedules giving their accurate self-perceptions on the competencies in ICT and completed Census schedules are brought back to Colombo within the shortest possible time, schools were closed at 1100h on the census day. After closing schools at 1100h, school coordinators trained all the relevant academic staff and the staff commenced completing the schedules. This method worked extremely well. Within 4 days, completed schedules from all districts of the country were brought back to the Department of Census and Statistics in - Colombo for data entry and processing.

Priority was given for processing of the data collected through the Census Schedule 2. Information collected in this schedule can be divided into two categories. Information on facilities and hardware available in schools belong to Category 1 while summaries of teachers' computer awareness, computer literacy and ability to read and understand documents written in English language belong to category 2. This report presents findings of the analysis of data collected through census schedule 2.

Two census Schedules were used to collect data in this study. The first – Census Schedule 1 - was a structured questionnaire to get the information on the teacher's own perceptions on their competencies in ICT. The ICT literacy of teachers was not measured by actually testing it by administering a test but by the teachers' own perceptions of their competencies. A copy of this questionnaire has been published in the website of the Department www.statistics.gov.lk. A brief description of the information collected by using Census Schedule – 1 is given below.

- a. **Demographic characteristics:** This section includes teacher's name, age, sex, and highest educational and professional qualifications, medium of teaching and main subjects taught.
- b. **Knowledge on computers:** Includes questions on the knowledge of computers/ICT of teachers and availability of hardware, facilities such as electricity and telephone, e-mail, Internet at home, qualifications in the field of ICT etc.

- c. Two most important questions included in this section are **awareness about computers** and **computer literacy**. For the purpose of this census a person is identified as aware about computers if he/she is aware about at least one use of computers such as typing letters, browsing Internet, playing games etc. **Computer literacy** is defined in many different ways. For this census a teacher is identified as computer literate if she/he can do some kind of task on her/his own by using a computer. Nature of the task is not important. It may be even playing a game using a computer.
- d. **Ability to use application software:** There are a few software packages commonly used in teaching. These are mainly used for word processing, spreadsheets related tasks, database management and presentations. Questions included in this section are on the teachers' ability to use these packages.
- e. **Use of computers:** This section has been designed to get information on how often teachers use computers, what purpose computers are used for and the commonly used software.
- f. **Use of Internet and e-mail:** Internet is an important tool of lifelong learning. It enhances the quality of student-teacher interactions. Several questions on the use of Internet and e-mails have been included in this section. Some of the questions of this section included are to assess frequency of internet/email use, purpose for which they are used, where these facilities are mostly used, whether teachers could search for information on line using Internet and whether they have their own e-mail address.
- g. **Knowledge on hardware:** Questions on whether teachers could perform simple hardware management tasks such as folder and file maintenance, installing software and testing disks for viruses are included in this section.
- h. **Use of computers for teaching:** The extent to which teachers use ICT for teaching is assessed in this section. This includes use of multimedia projectors, overhead projectors for teaching, use of mobile phone, and ability read and understands documents written in English language.

The second schedule was used to get the information on the ICT related facilities available in schools and summary of three questions of the first schedule. These questions are number of teachers in the school who are aware about computers and those who are computer literate and those who can read and understand documents written in English language.

3. Coverage

This census was conducted countrywide. For 3 districts in the conflict-affected areas - Jaffna, Mannar, and Killinochchi, completed census schedules are yet to be received. Of 9124 schools in other districts, 8388 returned the completed schedules. This is a very high response rate of 92 percent. However, the response rate for Mulativu (48%) and Vavuniya (38%) are low and therefore results for these districts should be used cautiously. Complete data for these districts will be included in the final report.

In addition to the government schools, there are 652 pirivenas in the country. Completed schedules were received for 77 percent of them. The total number of approved private schools in the country is 79. The response rate for approved private schools is 80 percent.

Tables 1 and 2 give the number of government schools, pirivenas and approved private schools, from which completed census schedule 2 was received by category of schools and number of students.

4. Availability of ICT related facilities

Sri Lanka has already achieved very impressive levels of most international indicators on education such as school enrollment, primary school completion rate, literacy etc. Now what is urgently required is to improve the quality of education, which in the context of the modern world includes provision of access to technology to students. One difficulty in doing so is the lack of availability of ICT facilities.

This chapter reports on the extent to which ICT related facilities (electricity, telephone, internet, e-mail etc.) and hardware (computers, printers, scanners etc.) are available in schools. Availability of facilities and hardware is presented by district; category of school i.e. National, Navodya, Other government schools, Pirivena and approved private schools; and number of students. Various characteristics of schools, to some extent, depend on the size of school measured in terms of number of students. Therefore, schools are grouped into 4 classes of size determined statistically by applying the Natural Break method to number of students. This method ensures that the resulting groups are homogeneous with respect to the variable used for grouping. The categories are 100 students or below, 100 – 300, 300 – 930 and 930 or more students.

4.1: Availability of electricity

For the proper use of ICT related hardware in schools electricity is required. Electricity is available in 76 percent of schools¹(Table 3/ Fig. 1/Map 1). The institutions best served are the National schools (99.4%), Navodya schools (97.9%), Pirivenas (98.4%) and approved private schools (96.8%). In contrast, just over 70% of other government schools have electricity available to them. As seen in Table 4, schools with smaller numbers of students are less likely to have electricity. Only half the schools with 100 or less students have electricity, while 99% of schools with more than 930 students have this facility (Table 4/Fig. 2).

Figure 3 shows the district variation of availability of electricity in schools. Over 90% of schools in the Western province - Kalutara, Gampaha and Colombo – and Galle have electricity available. At the lower end of the spectrum districts in the eastern and Southeastern parts have between 50% to 60% schools with electricity available to them.

¹ The term school is used here to include all categories of institutions included in this survey, which are National schools, Navodays, Pirivenas and Approved Private Schools.

4.2: Availability of telephone facilities

There are teaching and learning materials on almost any subject available in websites, which can be accessed through Internet. A telecommunication facility is required to use Internet. Dialup connection using a normal telephone line is still the most widely used method for accessing Internet, as other options are expensive. At national level, only 26 percent of the schools enumerated in this census have a land phone (Table 5). Schools best connected to land lines are national schools (95%) and approved private schools (94%). This is followed by Pirivenas (90%) and Navodya schools (67%). In contrast only 16% of other government schools have a landline connection available to them.

As seen in Table 6, as in the case of electricity, schools with smaller student size are the poorly served. Only 15 percent of schools with 100 students or less have a telephone facility while 85.8 percent of schools/pirivenas having 930 or more students have this facility.

Telephone connections in government schools vary from about 9% in Nuwara Eliya district to 58% in Colombo district. As seen in fig 6, in seven of the 22 districts enumerated, 15 percent or less of government schools have a telephone connection. These districts are Nuwara Eliya, Anuradhapura, Badulla, Kegalle, Matale, Polonnaruwa and Ratnapura.

4.3: Availability of Internet facility

The Internet makes valuable information available to teachers for use as teaching tools to augment textbook learning. For students, the Internet also provides easy access to a wealth of information for research and homework, and for sharing information and knowledge with other students across the nation and even internationally. To assess the extent of Internet availability, the census asked whether schools were connected to the Internet.

Nationally, Internet is available in only 6.4% schools, as yet. Highest availability of nearly 50% is in national schools and equally in private schools. Among the other government schools numbering 7639 enumerated, only 3% have Internet available to them, as seen in Table 7. Internet is also more available in larger schools, and almost not available in the small schools with less than 100 students (Table 8).

In most districts less than 10 percent of government schools have Internet. The largest proportions are in Matara (8.0%), Gampaha (8.1%), Galle (15.1%) and Colombo (17.0%) districts.

4.4: Availability of e-mail facility

E-mail is now used to exchange information in a speedy way. E-mail is useful for schools not only for teaching and learning activities but also for administrative purposes. Tables 9 and 10 present availability of e-mail facility in schools. Only 4.1 percent of schools in the country have this facility. This percentage is even lower than the availability of Internet facility. Availability of e-mail facility is highest in approved private schools with almost half of them having it. National schools follow somewhat behind with just about one third of them being provided (Figure 10). School size is closely related to the availability of this facility with 23% of availability in schools with 930 or more students and less than 1 percent of schools, having 300 or fewer students (Figure 11).

As seen in Fig. 12, in two districts - Galle (10.5%) and Colombo (10.8%), little over 10% of government schools have e-mail facility.

4.5: Availability of a computer laboratory

As for other sciences, it is necessary and important to have a computer laboratory to get hands on experiences on using computers. Overall, only 17 percent of schools are equipped with computer laboratories. The disparity in this facility is quite wide. Although 92 percent of national schools have a computer laboratory, only 10.5 percent of other government schools have such a place in their schools. (Table 10)

Tables 11 and 12 give the percentages of schools with a computer laboratory by district and number of students. About three fourths of schools with students 390 or more have computer laboratories.

As seen in Figure 15, availability is high only in a few districts Colombo, Galle and Gampaha. In all other districts, less than 20 percent of government schools are equipped with computer laboratories.

4.6: Availability of a library

Libraries are commonly available in most schools. At national level, 72 percent of schools/pirivenas have libraries. About 96 percent of Navodya and National schools have libraries (Table 13). Even 68 percent of “other government” schools have libraries. As seen in Table 14, small schools are the less well equipped. Only 57 percent of schools having 100 students or less have a library while the proportion is over 90 percent, in schools with more than 390 students.

District variation among the government schools, is also quite wide with under 40 percent in Batticaloa to 90 percent in Colombo. However, over 70 percent of government schools in all districts other than Anuradhapura, Badulla, Rathnapura, Nuwara Eliya, Puttlam, Ampara, Trincomalee, Vavuniya, and Batticaloa have libraries (Figure 18).

4.7: Availability of books/magazines on ICT

For self-learning by students and teachers about ICT, it is important to make textbooks, magazines etc. on ICT available in schools. In order to find out to what extent these books are available, it was asked whether such books were available in school for common use. Again over 80 percent of Navodya (80.6%) and National schools (93.7%) have such reading materials and this percentage for other government schools is only 21 percent. At national level, 26.8 percent of schools have this kind of books.

Governments schools with ICT related books are found mostly in Kalutara (32%), Gampaha (35%), Galle (42%) and Colombo (47%) districts. Only less than 30 percent of government schools in other districts have ICT related books (Figure 21).

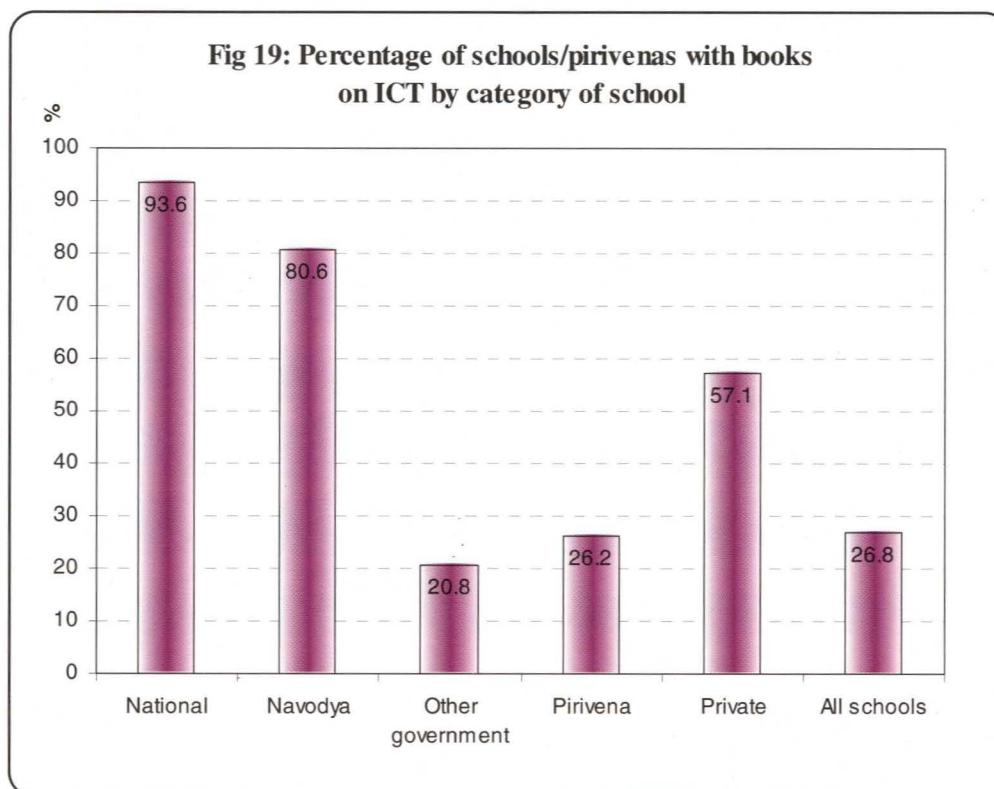

Fig 20: Percentage of schools/pirivenas with books on ICT by number of students

Map 5: Percentage of schools/pirivenas with libraries, computer laboratory and books on ICT by district - 2006

5. Availability of hardware facilities in schools

To use ICT in learning and teaching, certain hardware such as desktop computers, laptop computers, printers, scanners, multimedia projectors etc should be available in schools. To assess the penetration of ICT hardware into schools, data on availability of certain essential hardware were collected from schools. A brief description of the availability of these items is given below.

5.1: Availability of desktop computers

At national level only 29.6 percent of schools have desktop computers. The penetration of computers varies by category and size of schools. National (95.2%) and Navodya (90.1%) schools are better equipped with computers compared to other government schools (23.9%). Availability of desktop computers in Private schools (84.1%) is also considerably high. Only 17.0 percent pirivenas reported to have computers (Table 17).

Larger schools are better equipped with computers than smaller ones. The percentage of schools with 930 students or more having computers is 88.5 percent (Table 18). Availability of computers in schools with less than 100 students, 100 – 300 students and 300 – 930 students are 6.5, 17.7 and 46.5 percent respectively.

As seen in Fig 24, Colombo district has the highest proportion of 64 percent of schools with computers. In most of the other districts less than a third of the schools have computers with the exception of Matara (33.5%), Hambantota (34.5%), Kalutara (36.5%), Gampaha (41.2%), Galle (44.6%) and Puttalam (45.1%).

5.2: Student-computer ratio

School-level estimates of computer availability are typically reported as averages, such as the mean number of computers and the mean number of computers with Internet access. However, unlike ratio measures, averages do not take the school's enrollment size into account. The students-computer ratio is a proxy measure of the access or availability of computers to students in schools. Ratio measures, such as the number of students per computer, provide closer approximations of computer availability to students than estimates based on averages.

At national level student-computer ratio is 137. That is at national level, 1 computer is available for 137 students. Students-computer ratio by category of schools and number of students are given in the Tables 19 and 20. The student-computer ratio is lowest for the Navodya schools and it is 73. For National schools it is 110. The highest student-computer ratio is 275 for pirivenas.

There is a clear relationship between the number of students and students-computer ratio (Table 20). More the number of students lower is the student-computer ratio.

Student-computer ratio of government schools by district is presented in Fig 27. It shows that highest ratios exceeding 160 are in Monaragala, Ampara, Trincomale and Batticaloa districts, which are mostly in the eastern and southeastern parts of the country.

5.3: Teacher-computer ratio

Sufficient access to computers for teachers is important for them to use ICT in teaching. Access to computers is required for them to develop and test educational materials using various software programmes. In order to assess the teachers' access to computers teacher-computer ratio was calculated. In this census, computers available in schools have been considered and these are not computers specifically reserved for use of only academic purposes. At national level in schools/pirivenas, it stands at 7 teachers per computer. Among the categories of schools the lowest teacher-computer ratio of 3 was reported from Navodya schools. The highest ratio of 28 was reported for Pirivenas (Table 21).

Again the relationship to size of schools is clear as seen in Table 22. The highest teacher-computer ratio of 65 is in schools having less than 100 students and the lowest ratio of 5 in schools having 930 or more students.

In government schools, the ratio of teacher-computer lies in the range of 5 – 9 for all districts. As could be seen from Figure 30, the lowest teacher computer ratio of 5 was reported from Colombo district while the highest ratio of 9 was reported from the Monaragala, Matara and Batticalo districts.

Fig 29: Teacher-computer ratio of schools/pirivenas by number of students

5.4: Availability of printers

In this study, two indicators measured the availability of working computer printers in schools/pirivenas. The first indicator is schools with printers as a percentage of all schools/pirivenas. The second indicator is schools with printers as a percentage of schools having computers.

At national level although 29.6 percent of schools/pirivenas have computers, only 26.2 percent of schools have printers. This may be due to some schools either not having printers or having printers, which are out of order. Possibly due to the same reason this pattern could be seen when distribution is considered by category of school and by number of students as well. National schools (94.6%) and Navodya schools (90.8%) are the best equipped with one or more printers. Other categories of government schools are much less equipped (20.2%). Private schools are fairly well equipped with 79.4 percent having a printer. As seen in Tables 23 and 24, smaller schools are much less equipped. Only 4.3 percent of schools with less than 100 students have a printer.

Tables 25 and 26 give the schools/pirivenas with printers as a percentage of schools/pirivenas having computers by category of school and number of students. Not all schools with computers have printers and are therefore not able to fully utilize the computers. Just over 4 out of five schools with computers have printers. In general, over 80 percent of schools that have computers in most districts have printers, exceptions being Gampaha (75%) and Puttalam (74.2%).

Map 8: Percentage of schools/pirivenas with desktop computers and printers by district - 2006

5.5: Availability of scanners

Scanners are generally used to convert hardcopy materials into soft copies. These soft copies can then be used for many teaching and learning activities in the field of education such as exchanging such materials through e-mails, including in reports and presentations etc. Availability of scanners in schools/pirivenas was also assessed in this census. At national level only in 5.8 percent of schools/pirivenas have scanners. Availability of scanners in schools is presented in Tables 27 and 28 by category of schools and number of students respectively. The best availability of scanners is in private schools where nearly 2 out of 5 have a scanner.

Tables 29 and 30 give schools/pirivenas with scanners as a percentage of schools/pirivenas having computers by category of school and number of students. At national level, nearly one fifth of all schools/pirivenas with computers have scanners. Just under half of private schools with computers also have scanners.

5.6: Availability of multimedia projectors

Multimedia projector is a very important tool in teaching as it could be used to project materials on a computer screen to a larger screen so that many students see these materials, which otherwise only a few students around the computer can see. This instrument is still very expensive and possibly due to high costs only a few schools have multimedia projectors. At national level only 2.3 percent of schools have multimedia projectors. These are mainly the national schools (18%), which are also the large schools. No pirivenas are reported to have this facility (Tables 31 and 32). Even among schools that have computers, only 6.6 percent are equipped with projectors (Tables 33 and 34).

5.7: Availability of overhead projectors

Overhead projectors are used to project materials on transparent sheets into larger screens or to a wall. This facility has many limitations compared to multimedia projectors. Inability to display animations/video clips, which is possible with multimedia projector, is a major limitation. However, before multimedia came into use overhead projectors were widely used for teaching/presentations and could still be used effectively for teaching purposes. Availability of overhead projectors was also assessed in this study.

As could be seen from Tables 35 and 36, at national level, one fifth of schools/pirivenas have multimedia projectors. It is widely available in national and Navodya schools (over 80%) and in larger schools. As in the case of other facilities, even overhead projectors are rarely (15.5%) available in the schools belonging to the other government schools category. Hardly any schools with less than 100 students have a overhead projector. There is a considerable variation in availability of overhead projectors in government schools across districts as well. Colombo district reported the highest percentage of 34 percent while Nuwara Eliya district reported the lowest percentage of 14 percent.

6. Teachers' self reported computer awareness

Computer awareness is an indicator of the penetration of computers to the society. In this study, computer awareness was defined in very basic terms as knowledge of at least one use of computers. More specifically a teacher was identified as computer aware if he/she reported to have heard about at least one use of computers. At national level computer awareness of teachers in schools/pirivenas is 59.5%. Significantly there is only a small disparity between male (63%) and female (58%) teachers (Fig. 39).

According to a study conducted in 2004, by the Department of Census and Statistics, a much lower proportion of only 18 percent of people in Sri Lanka in the age group of 5 – 69 years, were aware about computers. There could be a number of reasons for the difference in these estimates. One is the age group. The very young and the more elderly are less likely to be computer aware. Secondly, teachers are among the more educated population and more likely to have access to technology. On the average, about 28 percent of teachers in government schools are graduate teachers. The percentage of trained teachers is 68 percent. Their chances of exposure to computers during training and studies are likely to be high.

Computer awareness across districts varies from 27 percent (Batticaloa) to 69 percent (Galle). Although it varies with school size, the variation is rather small from 52 percent in schools with 100 or less students to 64 percent with 930 or more students. (Tables 39 and 40).

Computer awareness of teachers in government schools by district and sex are presented in Fig. 41. An important observation is that the computer awareness is lower among female teachers relative to male teachers, and that the gap tends to be wider when the overall level is lower.

7. Teachers' Self-reported Computer literacy

Computer literacy is defined in many different ways. For the purpose of this study a teacher was identified as computer literate if he/she declared that he/she could use a computer on his/her own for any purpose. The nature of work was not considered. It could be anything including playing a computer game. As no test was administered to assess the literacy, what is reported here is self reported literacy by the above definition.

At national level, only about one third of teachers in schools/pirivenas reported that they are computer literate. More male teachers (39.1%) are computer literate than female teachers (29.5%) nationally and in all districts (Fig 44). National and Navodaya schools and larger schools have larger proportions of computer literate teachers (Tables 41 and 42). Since computer literacy of teachers is relatively low, it is important to take action to support teachers to improve their ability to use computers.

Variation in computer literacy across districts is displayed in Fig. 44 and Map 12. Computer literacy varies within a fairly narrow range of 30 percent to 40 percent except for Batticalo, Trincomalee, Kalutara, Matara, Hambantota, and Kegalle districts for which it is slightly less than 30 percent. Similar levels of literacy across districts may be due to the similar levels of education among teachers irrespective of their duty stations. An interesting observation is that computer literacy of teachers in Polonnaruwa and Nuwara Eliya districts is slightly higher than in Colombo district. A field verification showed that there are number of Computer Resource Centers in Polonnaruwa district. Teachers are being trained through various programs with the collaboration of local universities. This will be further investigated and findings will be presented in the final report.

In some districts computer literacy is high even though availability of computers in schools is low. To investigate this, a statistical test was carried out to see whether there is a relationship between availability of computers in schools and computer literacy of teachers. The finding is that there is no statistically significant relationship. This is a cause for concern. Having computers in schools alone do not improve the computer literacy of teachers. Traditional teaching using blackboards and textbooks perhaps is the dominant mode of teaching still and teachers have little or no time to use whatever available ICT facilities to enhance their own skills or to teach. This points to the need for policies and action to promote the use of ICT facilities by teachers.

8. Students-self reported computer literate teacher ratio

As reported by teachers themselves, only one third of teachers in schools/pirvenas are computer literate, which is a low level compared to the level required for making significant progress in teaching and learning using ICT. Student-computer literate teacher ratio is defined as the number of students per computer literate teacher. This ratio is quite high. At national level, it stands at 56 students per computer literate teacher (Tables 43 and 44) compared to general student to teacher ratio of 18 (Tables 45 and 46).

9. Teachers' self-reported Literacy in English Language

Still reading materials on ICT are largely available in English and other foreign languages. Therefore, ability to read and understand materials written in English is important for teachers particularly for self-learning. To assess the situation, teachers were asked to report whether they could read and understand documents written in English. The first page of national English newspapers was referred to as the standard reading material.

At national level 53.7 percent of the teachers in schools/pirivenas reported that they could read and understand documents written in English. More male teachers (56.0%) can understand such documents than the female teachers (52.7%) not only at national level but also at district level (Table 45) except for Colombo and Gampaha districts. As could be seen from Figure 48, this percentage is lowest for pirivenas and other government schools. Also as seen with many indicators it is clear from Figure 49 and Table 46 that this percentage is higher for larger schools.

Fig 48: Percentage of teachers who can read and understand documents written in english by sex and category of school

10. ICT facilities and computer literacy of teachers in government schools

Of the 8951 schools/pirivenas participated in this census, 8388 are government schools (National, Navodya and other government schools) which is about 94 percent of all educational institutions enumerated. This section briefly reviews the distribution patterns of ICT related facilities and hardware available in schools and computer and English language literacy of teachers in government schools across districts.

Figure 51 presents the variation in percentage of schools having telephone, Internet, e-mail, computer laboratory, books/magazines on ICT facilities and desktop computers. It could be seen from this figure that some of these facilities to some extent are concentrated in schools in districts of the Western and Southern provinces.

Availability of electricity and library facilities in government schools across districts are displayed in Figure 52. The distribution is not as asymmetric as it is for facilities such as telephone, Internet etc.

Fig 52: Percentage of government schools with electricity and library facilities by district

Fig 53: Self-reported computer awareness, computer literacy and english language literacy of government school teachers (percentages) by district

One of the barriers in learning and teaching ICT is availability of ICT teaching materials mostly in English and other foreign languages. A statistical test was carried out to see whether there is a relationship between self-reported computer awareness, computer literacy and English language literacy of teachers in these schools. This test showed that there is no significant relationship between English language literacy and computer awareness. But there is a highly significant positive relationship between English language literacy and computer literacy. As expected also found was that there is a highly significant positive correlation between computer awareness and computer literacy. Computer awareness was defined here as knowing about any use of a computer. But literacy was defined as the ability to perform a task on their own, using a computer, which requires at least basic knowledge in English language. This relationship could be readily seen from Fig. 53, which presents the district wise variation of self-reported computer awareness, computer literacy and literacy in English language.

ERRATUM: Table no. 46 (Page 105) of this document should be replaced by the table given below. Fig. 49 of page no. 100 should be corrected accordingly.
